Potential Backup file leaked via Nginx

- Advisory: GHSA-567m-82f6-56rv
- CVE: CVE-2024-53991
- Severity: high
- Published: 2024-12-19
- Updated: 2024-12-19

Affected

- `Discourse` (discourse): stable <= 3.3.2; beta <= 3.4.0.beta3; tests-passed <= 3.4.0.beta3

Description

Impact

This vulnerability only impacts Discourse instances configured to use `FileStore::LocalStore` which means uploads and backups are stored locally on disk. If an attacker knows the name of the Discourse backup file, the attacker can trick nginx into sending the Discourse backup file with a well crafted request.

Patches

This issue is patched in the latest stable, beta and tests-passed versions of Discourse.

Workarounds

To workaround the problem without upgrading, an admin can either

1. Download all local backups on to another storage device, disable the `enable_backups` site setting and delete all backups until the site has been upgraded to pull in the fix.

Or

1. Change the `backup_location` site setting to `s3` so that backups are stored and downloaded directly from S3.
