Google Indexes XSS

Today [Ghozt on the XSS forums](#) found a rather interesting link while searching google. He's found proof that Google will in fact index XSS. The link that Ghozt found was actually not a working XSS exploit, but that's irrelevant. In this case, if it had worked, Google would have indexed it and shown a working exploit. This is the first time I've seen 100% proof that Google will index cross site scripting attacks. Cool!

We all thought it probably was true, but until now I hadn't seen any verifiable proof of such. Sure enough this was indexed from a blog post by [Nitesh Dhanjani](#), [here](#) and [here](#). So perhaps there is some ranking associated with the potential importance of such a link, and therefor Google will only index an XSS if it is coming from a trusted host (raising the importance of persistent XSS on trusted domains - like .edu TLDs as [Jamie was talking about](#)). Either way, it's pretty exciting to see a theory turn into proof.
