workerd Memory-Corruption PoCs

Proof-of-concepts for five vulnerabilities in **workerd**, the runtime behind Cloudflare Workers and Code Mode, found and reported by Check Point Research. Author: Yarden Porat (@yarpo). Each PoC drives workerd to the vulnerable state so the bug is observable; exploitation is not included.

Fixed in workerd v1.20260619.1. Managed Cloudflare Workers were patched in production. No CVEs assigned.

#	Vulnerability	Type	Severity	PoC
1	node:zlib deflateParams()	use-after-free	Critical	zlib-uaf-rw-primitive-POC
2	HTMLRewriter AttributesIterator	use-after-free	Critical	htmlrewriter-iterator-uaf-POC
3	URLPattern standard (Ada)	out-of-bounds read	High	urlpattern-standard-oob-POC
4	URLPattern (workerd exec())	out-of-bounds read	Medium	urlpattern-oob-arbitrary-read-POC
5	Durable Objects KV SQL-authorizer bypass	unsafe deserialization	Medium	kv-sql-bypass-deserialization-POC

Each directory contains a Vulnerability.md (root cause), a Run.md (how to build and run), and a Dockerfile pinning the vulnerable workerd build.

The full exploit chains are available to vetted researchers on request: shahartal@checkpoint.com.
