Update: the results are now in!

Nominations are now open for the Top 10 Web Hacking Techniques of 2017.

Every year, numerous security researchers choose to share their findings with the community through conference presentations, blog posts, whitepapers, videos, and even simple disclosures. This is great, but the sheer volume and diversity means understated discoveries from aspiring

researchers can be overlooked, and even flashy vulnerabilities eventually get [eclipsed and forgotten](#) as people chase after the next shiny logo.

To help draw deserved attention to the most exciting and innovative research, since 2006 [Jeremiah Grossman](#) and [Matt Johansen](#) have annually collaborated with the infosec community to pick the top 10 new web hacking techniques of each year. Each year this produced two invaluable resources - a refined selection of ten must-read publications relevant to everyone in web security, and a vast list of research for other would-be researchers.

This was initially run on Jeremiah's blog, then moved to WhiteHat's in 2011: [2006](#), [2007](#), [2008](#), [2009](#), [2010](#), [2011](#), [2012](#), [2013](#), [2014](#), and [2015](#).

Unfortunately it stopped in 2015, but I believe it's needed now more than ever, so we've decided to pick up the torch at PortSwigger.

It's a bit late in the year, but we'll start **right now** with the top web hacking techniques of 2017.

Here's the plan:

- **Now:** Start collecting and verifying community nominations.
- **August:** We'll launch a community vote to elect a shortlist.
- **September:** A small panel of experts will vote on the shortlist to select the top 10, and we'll publish the results.

To keep things clean, we'll be excluding [our own research](#) from the top ten.

To nominate a piece of research, either [reply to this Twitter post](#), comment [on this Reddit thread](#), or [use this form](#). Feel free to make multiple nominations, and nominate your own research, etc. If you want, you can take a look at past years' top 10 to get a feeling for what people feels constitutes great research. Also, since 2016 was missed out, feel free to submit any particularly outstanding research from then.

Finally, whether this is successful or not ultimately depends on community involvement. We appreciate your contributions!

Nominations so far

Here are the nominations so far. We're making offline archives of them all as we go, so we can replace any that go missing in future. A few people nominated research published in 2018, so I've added that to a separate list for next year.

- [How I hacked hundreds of companies through their helpdesk](#)
- [Web Cache Deception Attack](#)
- [GitHubs post-CSP journey](#)
- [Request encoding to bypass web application firewalls](#)
- [Binary Webshell Through OPcache in PHP 7](#)
- [A deep dive into AWS S3 access controls taking full control over your assets](#)
- [CVE-2018-5175: Universal CSP strict-dynamic bypass in Firefox](#)
- [HaXmas: The True Meaning\(s\) of Metasploit](#)
- [The Good, The Bad and The Ugly of Safari in Client-Side Attacks](#)

- [Modern Alchemy: Turning XSS into RCE](#)
- [My Sweet Innocence Exposed - Eleven Reasons why we will all miss you, e](#)
