History 1966

-

The Dark Age 1994 1997 2000 Netscape's cookie_spec RFC 2109

RFC 2965 Basic Syntax Mechanism More Attributes Privacy Control Obsoletes RFC 2109 Set-Cookie2 & Cookie2 No browser followed these specs!

The Modern Age 2011 2015 2016 2016 RFC 6265 Cookie

Prefixes (RFC6265bis) Same-site Cookies (RFC6265bis) Strict Secure Cookies (RFC6265bis)
Obsoletes RFC 2965 Summarizes reality HttpOnly flag Improves Integrity across subdomains over secure channel Kills CSRF & Co. Prevents secure cookies overwrite from non-secure origin

None

None

[HTTP/1.1 200 OK [...] Set-Cookie: sid=123; path=/admin document.cookie = 'lang=en']
(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba48e5c2/slide_10.jpg)

HTTP Response JavaScript API (write)

[HTTP/1.1 200 OK [...] Set-Cookie: sid=123; path=/admin document.cookie = 'lang=en']
(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba48e5c2/slide_11.jpg)

POST /admin HTTP/1.1 [...] Cookie: sid=123; lang=en HTTP Response JavaScript API (write)
Subsequent HTTP Request document.cookie // sid=123; lang=en JavaScript API (read) *Attributes do not appear in requests

Set-Cookie: sid=123; path=/admin; Secure Name Value Attribute Flag Attribute Flag

Expires Max-Age Domain Path SameSite Secure HttpOnly

Attribute Flag Expires Max-Age Domain Path SameSite Secure HttpOnly We

will focus on these attributes in this talk

-

Domain

-

Set-Cookie: foo=bar; domain=.example.com example.com sub.example.com sub.of.sub.example.com Domain to subdomains

-

Set-Cookie: foo=bar; domain=.example.com sub.example.com example.com sub.of.sub.example.com Subdomains to subdomains

-

Set-Cookie: foo=bar; sub.example.com example.com sub.of.sub.example.com Current domain

-

None

-

None

-

None

-

Dot or no Dot? • They have no difference (old

RFC vs new RFC style) • Both widen the scope of a cookie to all (sub)domains • The correct way to limit the scope is to not have the domain attribute • Some websites add the domain attribute for all cookies • If one of the subdomains is compromised, such cookies will be leaked to unauthorized parties

-

– RFC 6265 (4.1.2.3.) "Some existing user agents treat an

absent Domain attribute as if the Domain attribute were present and contained the current host name."

-

Still isn't fixed in IE11 on Windows 7 / 8.1!

-

None

-

Cookie Bomb • Most servers have a length limit on

request headers • When this limit is exceeded, HTTP 413 or 431 is returned • Limited cookies injection can still result in client-side DoS • Domain & Expire attributes help persist the attack across (sub)domains.

-

None

-

None

-

[https://example.com/aaa...aaa https://twitter.com/#a
https://example.com/aaa...aaa https://twitter.com/#b
https://example.com/aaa...aaa https://twitter.com/#c GET / HTTP/1.1 [...]]
(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba48e5c2/slide_28.jpg)

Cookie: ev_redir_a=aaa...aaa; ev_redir_b=aaa...aaa; ev_redir_c=aaa...aaa } 8kB+

-

None

-

Shared domains're vulnerable by design e.g. github.io

-

Public Suffix List • Community curated • Some domains cannot

have cookies • The same list that restricts domain=.com.tw

-

None

-

None

-

XSS+OAuth • Say you have a boring XSS • And

the site is using OAuth • Sounds like you can use the XSS to takeover accounts?

-

Expectation https://google.com/oauth?client_id=example HTTP/1.1 302 Found
Location: <https://example.com/oauth/callback?code=123> Set-Cookie: sid=123
HTTP/1.1

302 Found Location: <https://example.com/home> Steal

-

Reality https://google.com/oauth?client_id=example HTTP/1.1 302 Found
Location: <https://example.com/oauth/callback?code=123> Set-Cookie: sid=123 HTTP/1.1

302 Found Location: <https://example.com/home> Steal 1. Authorization code is single-use 2.
Intermediate HTTP Redirect is transparent

-

XSS++OAuth 1. Perform Cookie Bomb Attack via XSS 2. Embed

an iframe pointing to OAuth IdP 3. It redirects to target with the authorization code 4. Server
rejects the request due to large header 5. Use XSS to get the authorization code from iframe URL

-

<https://example.com> https://google.com/oauth?client_id=example

-

<https://example.com> <https://example.com/oauth/callback?code=123> `iframe.contentWindow.location.href`

-

None

-

Path & HttpOnly

-

This is a valid request True or False? POST /admin

HTTP/1.1 [...] Cookie: csrf_token=foo; csrf_token=bar

-

None

-

Cookie Tossing • Cookie key consists of the tuple (name,

domain, path) • Each cookie-key-value has their own attribute list • (Sub)domains can force a cookie with the same name to other (sub)domains • Browser sends all cookies of the same name without attributes • Server thus has no way to tell which one is from which domain/path

GitHub Pages used to be on *.github.com

None

Scenario • Had an XSS on ton.twitter.com where contents are

static • twitter.com uses auth_token for session ID and _twitter_sess for storing CSRF token • Could modify _twitter_sess with an attacker-known value and have site-wide CSRF • However it's protected by HttpOnly

HttpOnly • Cookies with this flag cannot be read/write from

JavaScript API • Safari before version 12 has a bug that allows writing to HttpOnly cookies with JavaScript API • Cookie Tossing can also help “bypass” this flag, as you can create a cookie with the same name but different key tuple

Expectation Name Value Domain _twitter_sess original _twitter_sess attacker's .twitter.com POST

/i/tweet/create HTTP/1.1 [...] Cookie: _twitter_sess=attackers; _twitter_sess=original
authenticity_token=attacker-known

Reality Name Value Domain _twitter_sess original _twitter_sess attacker's .twitter.com POST

/i/tweet/create HTTP/1.1 [...] Cookie: _twitter_sess=original; _twitter_sess=attackers;
authenticity_token=attacker-known

-RFC 6265 (5.4) 2. The user agent SHOULD sort the

cookie-list in the following order: * Cookies with longer paths are listed before cookies with shorter paths. * Among cookies that have equal-length path fields, cookies with earlier creation-times are listed before cookies with later creation-times.

Precedence matters • Specs do not mention how to handle

duplicate cookies • Most servers accept the first occurrence of cookies with the same name (think of HPP) • Most browsers place cookies created earlier first

-

-RFC 6265 (5.4) 2. The user agent SHOULD sort the

cookie-list in the following order: * Cookies with longer paths are listed before cookies with shorter paths. * Among cookies that have equal-length path fields, cookies with earlier creation-times are listed before cookies with later creation-times.

-

Revised Attack Name Value Domain Path _twitter_sess original / _twitter_sess

attacker's .twitter.com /i/ POST /i/tweet/create HTTP/1.1 [...] Cookie: _twitter_sess=attackers; _twitter_sess=original authenticity_token=attacker-known

-

-RFC 6265 (6.1) Practical user agent implementations have limits on

the number and size of cookies that they can store. General-use user agents SHOULD provide each of the following minimum capabilities: o At least 4096 bytes per cookie (as measured by the sum of the length of the cookie's name, value, and attributes). o At least 50 cookies per domain.

-

Overflowing Cookie Jar • Another way to “overwrite” a HttpOnly

cookie is to remove it • Browsers have a limitation on how many cookies a domain can have • When there is no space, older cookies will get deleted • Drawback: it's not always easy to know how many cookies a victim has (tracking cookies are unpredictable)

-

More Cookie Tossing Application

-

Self-XSS to full XSS Selectively forcing attacker's session cookie on

certain paths

-

<https://attacker.myshopify.com> https://attacker.myshopify.com/admin/oauth/authorize?client_id=editor <https://script-editor.shopifycloud.com/oauth/callback?code=attackers> document.cookie='_master_udr=attackers;path=/admin'

n/oauth https://victim.myshopify.com/admin/oauth/authorize?client_id=edit or https://script-editor.shopifycloud.com/oauth/callback?code=victims Login “CSRF” Re-login victim

Self-XSS in iframe executing with victim's session

-

Session Fixation Forcing attacker's session cookie with a subdomain XSS

-

https://script-editor.shopifycloud.com document.cookie='_flow_session=attackers;domain=.shopifycloud.com' https://victim.myshopify.com/admin/oauth/authorize?client_id=flow GET /oauth/callback?code=victims HTTP/1.1 Host: flow.shopifycloud.com Cookie: _flow_session=attackers

Force a session cookie scoped to .shopifycloud.com using XSS OAuth redirect with authorization code

-

Implementation Discrepancy

-

Multiple Cookies at Once? • We can only set one

cookie at a time in a single Set-Cookie header • However, the older specs allow setting multiple in a single Set-Cookie header

-

Cookie based XSS Exploiting limited Cookie Injection with Safari

-

–RFC 2109 (4.2.2) “Informally, the Set-Cookie response header comprises the

token Set-Cookie:, followed by a comma-separated list of one or more cookies.”

-

[Set-Cookie: foo=123; path=/admin; HttpOnly;, bar=456; Secure GET /admin HTTP/1.1 [...]]

(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba48e5c2/slide_66.jpg)

Cookie: foo=123; bar=456 Works in Safari before version 10

-

[https://outlook.live.com/owa/?realm=hotmail.com;, ClientId='-alert(2)'
HTTP/1.1 200 OK [...] Set-Cookie: realm=hotmail.com;, ClientId='-alert(2)'
(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba4
8e5c2/slide_67.jpg)

/ HTTP/1.1 [...] Cookie: realm=hotmail.com; ClientId='-alert(2)'
window.clientId = "-alert(2)"; Safari sets 2 cookies

-

CSRF Cookie Injection Server accepting comma separated cookies

-

-RFC 2965 (3.3.4) “For backward compatibility, the separator in the

Cookie header is semi-colon (;) everywhere. A server SHOULD also accept comma (,) as the separator between cookie-values for future compatibility.”

-

[http://blackfan.ru/r/,m5_csrf_tkn=x;,domain=.twitter.com;path=/
__utmz=123456.123456789.11.2.utmcsr=blackfan.ru| utmccn=
(referral)| utmcct=/ r/,m5_csrf_tkn=x POST /messages/follow HTTP/1.1 [...]
Cookie: __utmz=123456.123456789.11.2.utmcsr=blackfan.ru| utmccn=
(referral)| utmcct=/r/,m5_csrf_tkn=x]
(https://files.speakerdeck.com/presentations/d818b3c106a14efb9f73171dba4
8e5c2/slide_70.jpg)

m5_csrf_tkn=x Cookie set by Google Analytics on translation.twitter.com
scoped to .twitter.com Twitter’s server parses it as 2 cookies

-

Defense

-

Cookie Prefixes • Cookies prefixed with __Host- cannot have Domain

attribute • This prevents (sub)domains from forcing a cookie the current domain doesn’t want • Cookies intended for (sub)domains are still vulnerable to Cookie Tossing • Use a separate domain for user generated assets

-

None

-

Servers must only follow RFC 6265

-

PSA: CSRF & others will be dead in 2020

-
