So, right.. I was trying to read some stuff about problems sharing my wired connection of my linux laptop to another windows laptop via wireless, but one of the links was on mail-archive.com, and for some reason it's blocked on China (yeah, I'm living on China now =D). So, I decided to go to a friend's website to read the webpage, but... suddenly, there was an error..

Bad Request Your browser sent a request that this server could not understand.

Size of a request header field exceeds server limit.

Cookie:

The reason of the error is unknown, but that's not important, what is important is that I realized that with a big enough cookie (8190 bytes aprox) we can DoS someone from entering a webpage. (With a 400 HTTP Response status code on Apache, a 413 on some google services, and on some websites an infinite loop because the big cookies delete session cookies).

The reason we would like to block from accessing a server is not really important, what is important is that being able to block them out is dangerous.

Anyway.. we need to set cookies, and this is good enough for a lot of attacks (like no-ip domains, shared subdomains like blogspot, browsers that allow top level domain cookies, second level domains like .co.uk, etc..), but I really wanted to do something more cool.. so I started thinking, how to set cookies on clients.

And the "how", as the reader may deduce from the title of this blogspot is using Google Analytics. I've been researching Google Analytics cookies for some time now, so I sort-of know how they
