Overview

One platform to Secure Every Identity

Identity is the control plane for the AI enterprise. Introducing Idira®, the only platform that seamlessly integrates modern privilege access management (PAM), machine and agentic identity security capabilities.

Challenges

Uncontrolled privileges.

Explosive growth.

Unmanaged risk.

Legacy identity solutions were built for yesterday's problems, where elevated privileges were reserved for a select few. Now, all identities need broad privileges, leaving you vulnerable to identity breaches.

96%

of human users have access beyond what is required.

109:1

machines outnumber human identities.

99

out of 100 organizations have adopted AI agents.

Redefining modern PAM for the agentic era

AI has fundamentally changed who and what has privilege inside the enterprise, as every identity can now operate with autonomous access to sensitive systems at scale and speed.

Idira disrupts the status quo with modern PAM extending privilege control to every identity to minimize attack surface.

How it works

The Identity Security Control Plane

Idira secures every identity with a unified control plane that discovers risk, applies privilege dynamically and governs the full lifecycle from first access to final session.

Solutions

Secure Every Identity: Human, Machine and Agentic

Extend privileged-grade protection beyond administrators to every identity that matters.

Human

One trusted platform for your modern privileged access, endpoint and identity governance needs.

[Learn more **](#)

Machine

Secure every machine identity — from secrets to workloads — with one unified solution.

[Learn more **](#)

Agentic

Discover, control and govern agentic identities at scale to accelerate AI innovation.

Frequently Asked Questions About the Idira Platform

We're a long-time CyberArk customer. What does this transition to Idira mean for us?

CyberArk has long been your trusted partner for securing privilege and defending your critical assets. Now, we're introducing Idira, the next-generation identity security platform, built on CyberArk's legacy and powered by Palo Alto Networks. If you're an existing CyberArk customer, you can continue to use the platform as you always have. You'll just notice a new logo and design. Over time, you'll be able to leverage cross-platform capabilities across the Palo Alto Networks product portfolio.

How does the platform support a zero trust architecture?

The Idira Identity Security Platform supports zero trust by enforcing least privilege and securing access for human, machine and agentic identities across any device. Privilege controls are used to help isolate and stop attacks, protect critical assets and grant access for just the right amount of time. Also, the platform continuously monitors threats so organizations can adjust controls based on risk.

How does modern PAM delivered through Idira next-gen Human Identity Security help?

Modern PAM provides comprehensive discovery, removing blind spots with continuous visibility and AI-driven analytics, and dynamic privileged access, eliminating always-on standing privileges and radical simplicity through a unified command center that streamlines deployment through automation and embeds threat detection directly into privileged workflows.

Does the platform secure nonhuman identities (NHIs)?

Yes, Idira platform secures every identity — human, machine and agentic. The latter two are often referred to as nonhuman identities. It includes discovery, risk analytics and modern secrets management, including governance and reporting for all vaults and workloads, satisfying audit and compliance requirements. It includes security remediation for unmanaged secrets and modern secrets management, reducing risks relating to exposed secrets across all environments. It's fully integrated with modern CI/CD pipelines, giving developers native access to tools, increasing efficiency and automation.

[Learn more about machine identity security](#)

How can Idira platform help us as we adopt AI agents in our organization?

Idira Identity Security Platform is built to seamlessly extend identity security and privilege controls used for human and machine identities to secure the new wave of autonomous AI agents. Idira Secure AI Agents scans SaaS, cloud and developer environments to identify active agents and enrich them with vital context like ownership and permission levels. Once you have visibility, Idira can enforce privilege controls like granting agents access only for the duration of a specific task. Idira also provides auditability into the actions agents are taking. These agentic security capabilities are the foundation your organization needs to keep up with the growth of AI agents.

Idira makes identity governance simple and secure. The platform unifies visibility, automates access decisions and reduces identity risk across human and machine identities throughout their entire lifecycle.

[Learn more about identity governance](#)

Idira has over 300 out-of-the-box integrations and over 200 alliance partners. Our partner network makes it easy to unlock the power of Idira across your enterprise.

Yes. Idira Endpoint Privilege Manager protects endpoints and servers by enforcing least privilege and controlling application execution. It provides an endpoint security layer to reduce the attack surface, improve operations and deliver compliance.
