TOC Element

Searchlight Cyber's security research team has discovered a pre-authentication RCE in WordPress Core. The attack has no preconditions and can be exploited by an anonymous user in a stock install of WordPress with no plugins.

It is estimated that over 500 million websites use WordPress.

Given the severity of the bug and to give defenders time to patch, we are not releasing technical details at this time. We are, however, releasing a website to determine if your instance is

vulnerable. You can find it here: wp2shell.com

wp2shell[.]com is a public tool developed by Searchlight Cyber

Affected WordPress versions

- `<= 6.8.5` : not affected.
- `6.9.0 - 6.9.4` : affected.
- `7.0.0 - 7.0.1` : affected.

Mitigation

The best way to protect yourself is to update WordPress to version 7.0.2, or 6.9.5 if you are on the 6.9 branch. as soon as possible. If this isn't possible, you can temporarily protect your instance by blocking anonymous access to the batch API, either by:

- Installing a plugin that blocks anonymous access to the rest API entirely; or
- Blocking `/wp-json/batch/v1` and `?rest_route=/batch/v1` at a WAF level.

Note that both these solutions may have an impact on legitimate use of the site and should only be considered emergency temporary measures until you can update.
